Graduate Research Assistant

## **Executive Summary**

The federal workforce in the Washington DC Metropolitan Area is decreasing after 12 years of gains. According to the Bureau of Labor Statistics, from 1998 to 2010 the number of federal workers increased by 19 percent reaching its peak in July 2010. Between July 2010 and December 2011, the number of federal workers had decreased by 1.2 percent. These changes in the federal workforce are reflected in their demographic profile and distribution across income and pay grades.

The key findings of this research are:

- The distribution of federal employment changed nationally and in the Washington DC Metropolitan Area between 1998 and 2011 – lower GS grade-level employment decreased and the number of managerial and executive positions increased.
- The federal workforce is aging – in the Washington DC Metropolitan Area the modal age grouping has shifted from 45-49 to 50-54 years old between 1998 and 2011.
- The mix of males and females in the federal workforce has changed – the proportion of females in the higher grade-level positions surpassed the proportion of males.
- The years of service have changed – the number of workers with less than 5 years of experience increased by 125.2 percent and the number of workers with 35 years of service or more increased by 112.3 percent between 1998 and 2011.
- The total salaries paid to the federal workforce have increased by 34.1 percent between 1998 and 2011.

This research has shown that outsourcing of the lower- and medium-level federal jobs is accompanied by the concentration of the remaining employees in the higher-level positions. The federal workforce is becoming older and characterized by over three decades of federal experience. The large increase in the number of workers with less than five years of service is accompanied by a minimal increase in the number of young workers and an increase in the number of older workers which suggests that a large portion of the new hires are workers 55 years old or more. If these trends continue, the General Schedule and Equivalent Grade System will include fewer federal workers in favor of the private sector

and the “shadow” federal workforce, such as federal contractors or grantees. The older federal workforce will be gradually retiring in the coming years. One possible implication of these changes is that the government will have to hire replacement workers from outside of the current federal worker base to fill vacated managerial and executive positions. Alternatively, the federal workforce will shrink resulting in a smaller federal payroll. The changes in the distribution, demographics and characteristics of the federal employment in the Washington DC Metropolitan Area are notable. The new trends call for ongoing research and discussion about the future of the federal government as a generator of jobs and its evolving role in the regional economy.

## **Introduction**

This analysis examines the change in the distribution and characteristics of a subset of the federal workforce as divided among the General Schedule and Equivalent Grade (GS) and Senior Executive Service (SES includes permanent career workers) over the 1998-2011 period using data provided by the Office of Personnel Management (OPM)<sup>1</sup>. This research includes 1,498,615 federal workers nationally and 247,334 federal workers in the Washington DC Metropolitan Area, and includes information on the changes in the distribution of the workforce across pay grades, age, gender, length of service, and salary. Finally, the analysis identifies possible reasons for these trends and their implications.

### **Change in the Distribution of the Federal Workforce by Grade Level**

Since 1998, the national and the Washington DC Metropolitan Area federal employment experienced its greatest growth in managerial and executive positions. The magnitude of the changes has been greater in the Washington DC Metropolitan Area where the decrease in lower GS grade-levels and the increase in the upper GS and SES grade-levels were stronger than in the U.S. as a whole (Figure 1). The losses of lower and medium grade-level workers and the growth of the highest grade-level workers in the Washington DC Metropolitan Area reflects the concentration of a better-educated, more-experienced, and better-paid workforce (Figure 2).

### **Change in the Distribution of the Federal Workforce by Age**

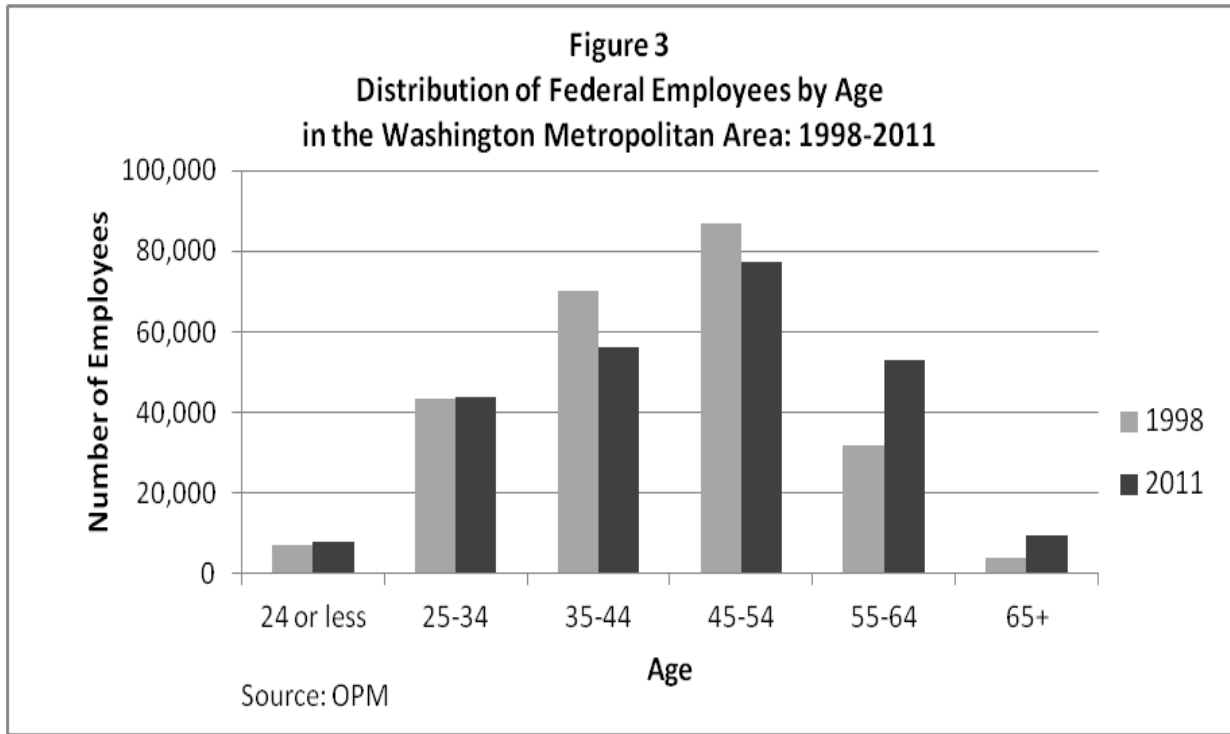

The distribution of the federal workforce is aging (Appendix, Figure 1). The trend shows a downward tendency in the number of employees between 34 and 54 years old, suggesting that workers are leaving federal employment at mid-career. The most notable change is among the 55-64 year olds (up 66.2%) and those 65 years old and older (up 129.2%). These two groups made up one-quarter of the total

---

<sup>1</sup> OPM does not provide detailed enough description and data on the workers paid by other than GS and SES systems, so this analysis excludes these workers. It is a considerable limitation as these workers, including contractors, grantees, members of armed forces, reservists, federal employees in the judicial branch, and most employees in the legislative branch, make a large portion of the total federal employment.

federal workforce as of 2011 and will begin to retire in increasing numbers in the near future (Figure 3, Figure 4).

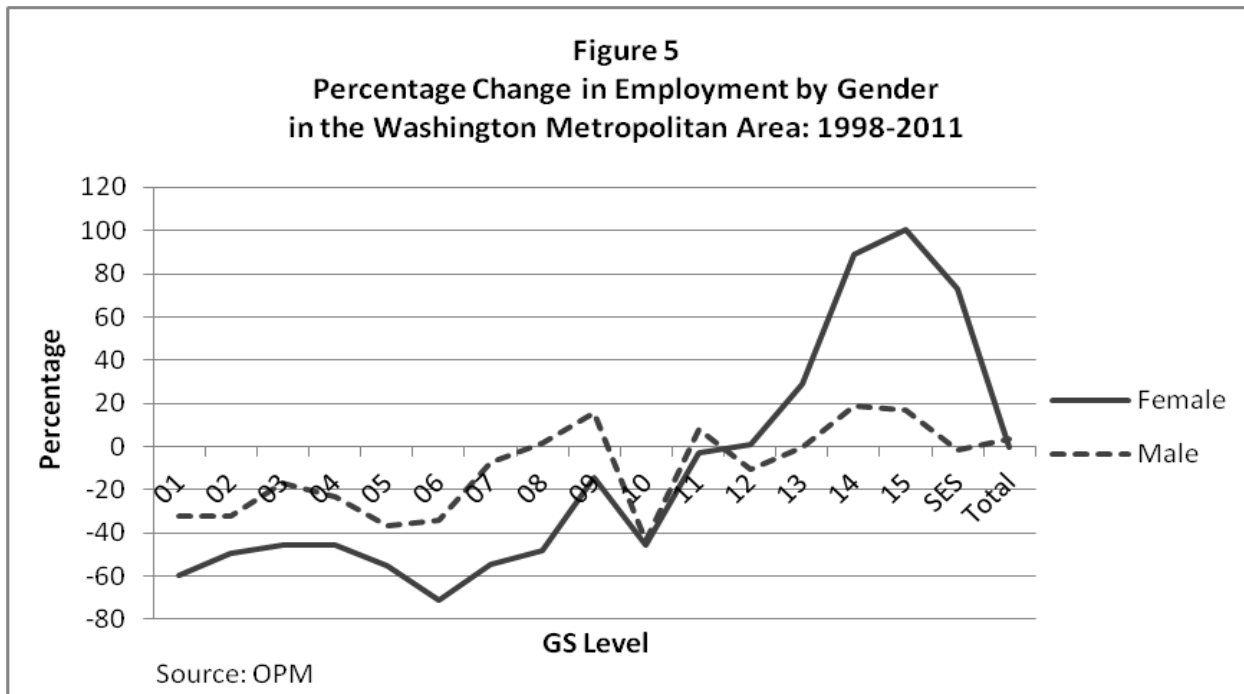

## Change in the Distribution of the Federal Workforce by Gender

There was a substantial shift in the distribution of male and female federal employment between 1998 and 2011. The trend shows that the total number of males increased while the total number of females decreased. The decline in the participation of females in the lower GS grade-levels was much greater than for males. At the same time, the change in the participation of females in managerial and executive positions grew more than males, increasing by 33.7 percent and 6.7 percent, respectively (Table 1). The greatest difference in the distribution of male and female workers is evident in the GS-15 where the growth of female participation was higher than male by 84.0 percentage points (Figure 5).

**Table 1**  
**Distribution of Federal the Workforce by Gender in the Washington Metropolitan Area, 1998 and 2011**

	Number			Percent of Total		
	1998	2011	% Change	1998	2011	% Point Change
Male	113,727	117,937	3.7	46.6	47.7	+1.1
Female	130,097	129,397	-0.54	53.4	52.3	-1.1
Total	243,824	247,334	1.44	100	100	
Male GS 1-10	17,867	15,653	-12.4	7.3	6.3	-1

Male GS 11-SES	95,859	102,284	+6.7	39.3	41.4	+2.1
Female GS 11-SES	75,023	100,314	+33.7	30.8	40.6	+9.8

Source: OPM

## Change in the Distribution of the Federal Workforce by Length of Service

The distribution of federal workers by length of service changed between 1998 and 2011 (Figure 6). There has been a downward trend in the number of workers with 5 through 34 years of service. Simultaneously, there has been an increase in the number of workers with less than 5 years of federal experience (up 125.2%) and with 35 or more years of service (up 112.3%)<sup>2</sup>. The large increase in the number of workers with less than 5 years of service is accompanied by a small increase in the number of young workers and by a large increase in the number of workers 55 years old or more. This trend shows that new workers tend to be older and preparing for retirement as a part of the federal workforce. Also the increase in the number of federal workers with 35 years of service or more is related to the overall aging of the federal workforce. These workers are about to meet or have already met the government requirements of age and tenure to retire, opening their positions to younger workforce at lower pay-grades.

<sup>2</sup> The results may not be fully accurate due to undercounting of the federal employees when broken down by the length of service, as provided by OPM. When compared to the totals reported elsewhere in this analysis, the 1998 total number of workers is missing 26 employees, and the 2011 total number of workers is undercounted by 8,732 employees.

## Change in the Distribution of the Federal Workforce by Salary

The average salary earned by federal workers has grown across all the pay grade levels, increasing the most in the managerial and executive positions (Figure 7). On average, in 2011 males made 24.9 percent more and females made 42.6 percent more than in 1998. The greater growth in average salary is related to the faster growth of female participation in the better-paid managerial and executive positions (Appendix, Table 5).

Total salaries paid to federal workers in each GS level have decreased for the lower-grade positions and SES while increasing in the mid-management and management positions. This change corresponds with the decrease in the number of lower GS grade-level workers and the increase in the number of managerial positions over this period. Accounting for the change in the total number of employees and the change in average pay, the total salaries paid to all the federal employees increased by 34.1 percent between 1998 and 2011.

## Conclusion and Implications

The distribution and characteristics of the federal workforce in the Washington DC Metropolitan Area have changed between 1998 and 2011.

The key findings from the research are:

- The distribution of federal employment nationally and in the Washington DC Metropolitan Area changed over the 1998-2011 period reflecting a decrease in the size of lower GS-level employment and an increase in managerial and executive positions. The magnitude of the changes was greater in the Washington area than nationally.
- The proportion of females in the federal workforce decreased overall but the participation of females in managerial and executive positions grew at a faster rate than for male workers.
- The proportion of workers 55 years old and older increased while the number of workers 35-54 years old decreased.
- The number of workers with less than 5 years of federal experience increased by 125.2 percent and the number of workers with 35 years of service or more increased by 112.3 percent between 1998 and 2011.
- The compensation of the total federal workers increased as a result of the increased number of employees in managerial and executive positions and the decline in the number of employees in lower-level and lower-paid GS levels.

These changes have resulted from the outsourcing of the lower- and medium-level federal jobs and the aging of the federal workforce as reflected in the rapid expansion of federal contracting over the 1998-2011 period. The concentration of older and experienced workers in high pay-grade levels in the Washington D.C. Metropolitan Area is seen in the growth of the federal payroll increasing from \$20.7 billion in 1998 to \$42.3 billion in 2010, or by 104.3 percent. As these older workers retire in increasing numbers, their positions are likely to be filled by workers at lower pay grades or steps resulting in a smaller federal payroll. The federal payroll will also decrease in response to budget pressures to reduce federal spending.

Overall, the trends in the distribution, demographics and characteristics of the federal employment in the Washington DC Metropolitan Area are clear. These trends require continuing research and discussion concerning the future of the federal government as a source of employment in the region.

### Summary Table
